THE PROBLEM

“It's broken.”

That's the whole bug report.

No steps. No expected vs. actual. No page.

Engineers spend the first hour just figuring out what the user saw.

#support · 2:14 PM

“checkout is wrong??

pls fix asap”

But they can record it in 10 seconds.

Everyone has a phone. Nobody wants to write a ticket.

VIDEO2PR

Video in, PR out.

Record a bug. Devin watches it, writes the bug report, fixes the code, and opens a pull request.

↑ one Devin session owns both steps

FastAPI · ffmpeg · Devin API (structured output + sessions) · vanilla JS frontend

Live demo

GT Dining → record the bug → video2pr

WHY DEVIN

One agent, the whole loop.

1. **Sees**
   Reads the video frames and writes a structured report

2. **Reproduces**
   Opens the real app and follows the steps

3. **Fixes + proves**
   Commits the fix with before / after screenshots

4. **Human stays in charge**
   Nothing merges without review

WHERE IT PLUGS IN

- “Record a bug” button in any app
- Support desk: customer videos → PRs
- QA & beta testers: no ticket writing
- Parallel: 4 videos → 4 fixes at once
