THE PROBLEM

“It's broken.”

That's the whole bug report.

No steps. No expected vs. actual. No page.

Engineers spend the first hour just figuring out what the user saw.

#support · 2:14 PM

“checkout is wrong??

pls fix asap”

But they can record it in 10 seconds.

Everyone has a phone. Nobody wants to write a ticket.

VIDEO2PR

Video in, PR out.

Record a bug. An AI agent watches it, writes the bug report, fixes the code, and opens a pull request.

↑ **one agent session owns both steps**

FastAPI · ffmpeg · AI agent API (attachments · structured output · sessions) · vanilla JS · parallel sessions

STEP ZERO · INSIDE THE APP

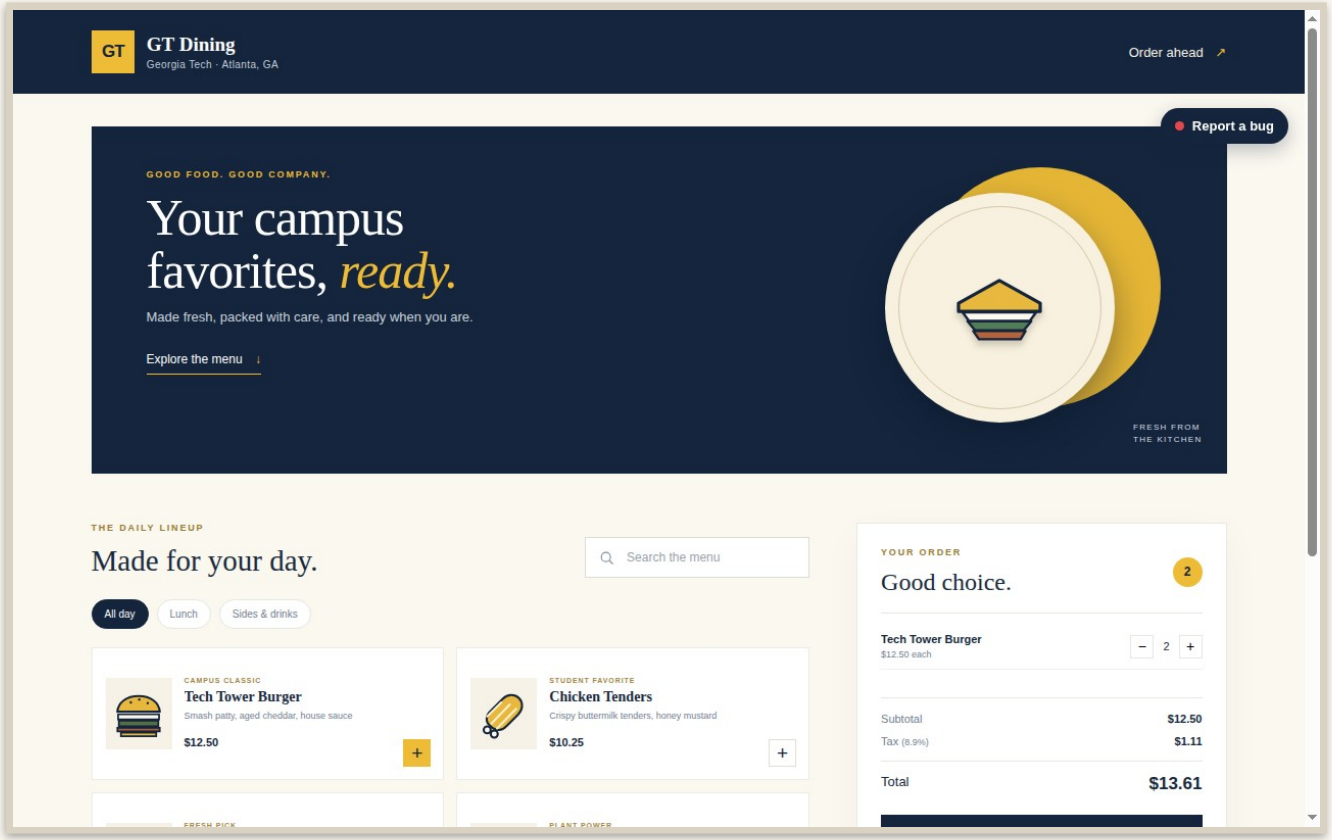

One click. No ticket.

One click starts a screen recording of the tab.

Stop & send uploads it to video2pr automatically.

No typing. No file to find.

The user just shows what went wrong.

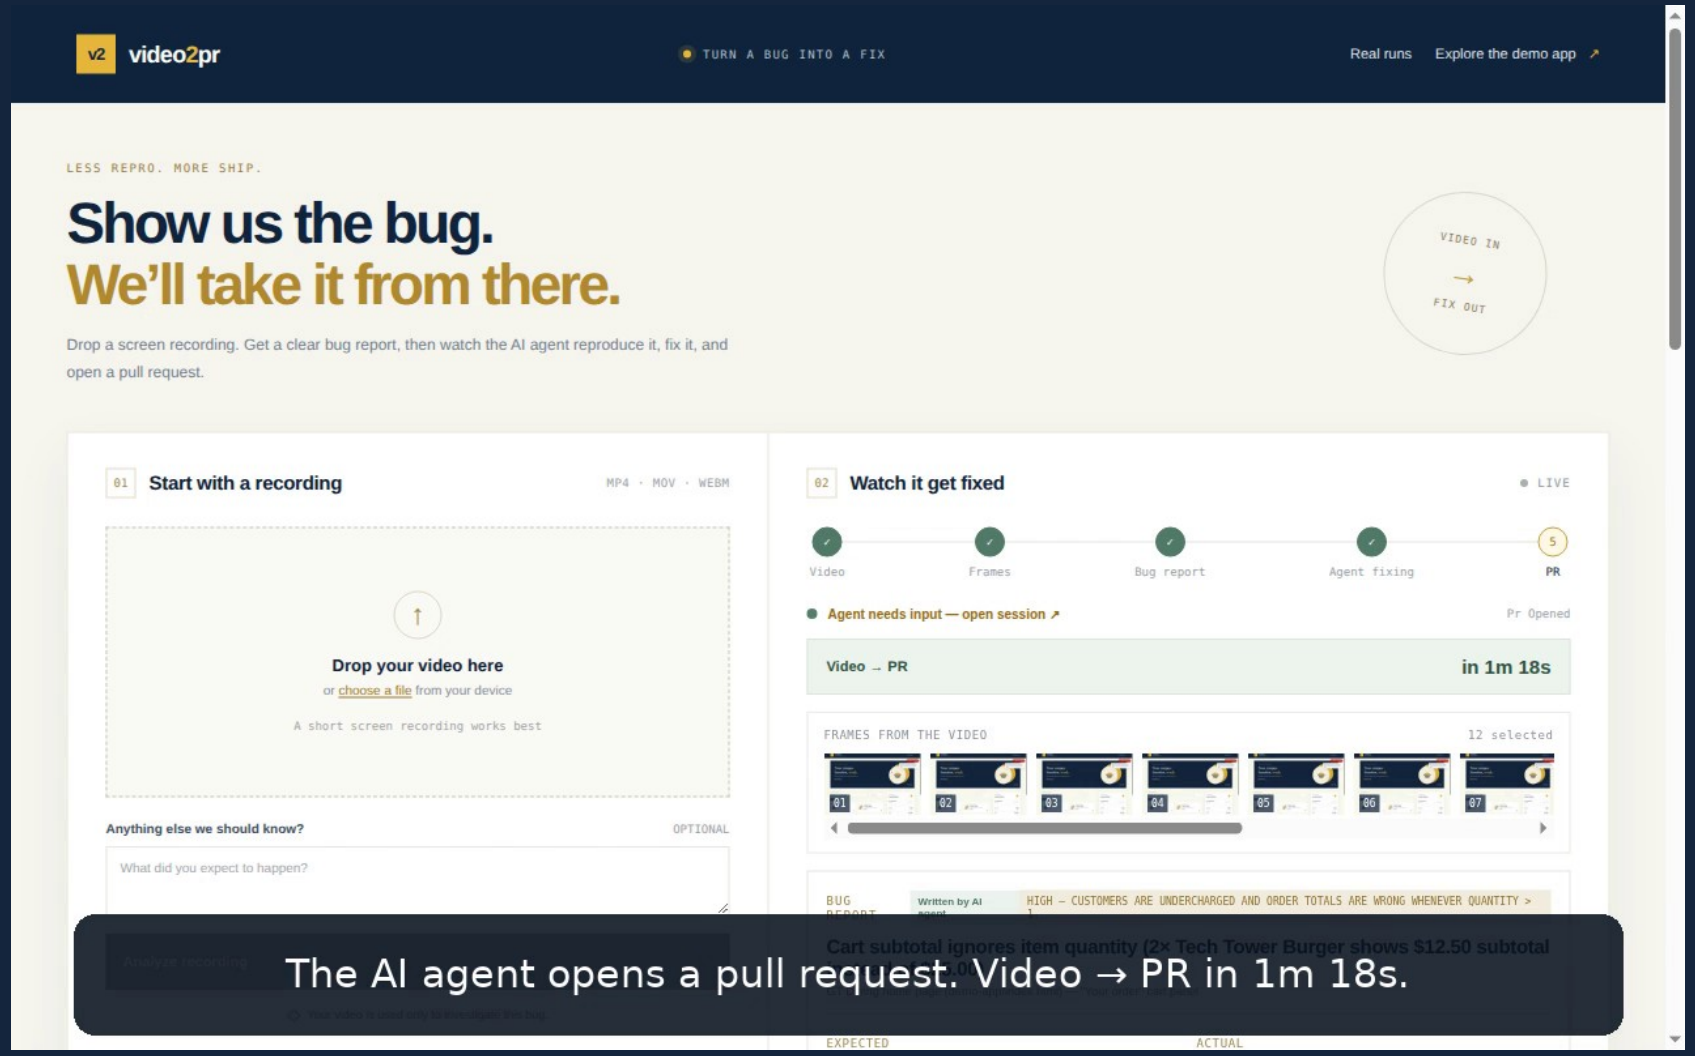

Live demo

GT Dining → “Report a bug” → AI agent → pull request

DEMO VIDEO · REAL RUN

Watch it run, end to end.

REAL RUN · NO MOCK

Video → PR in 1m 18s.

0:00

Recording sent

from the “Report a bug” button

0:37

Agent writes the bug report

from the screenshots alone, no text hint

1:18

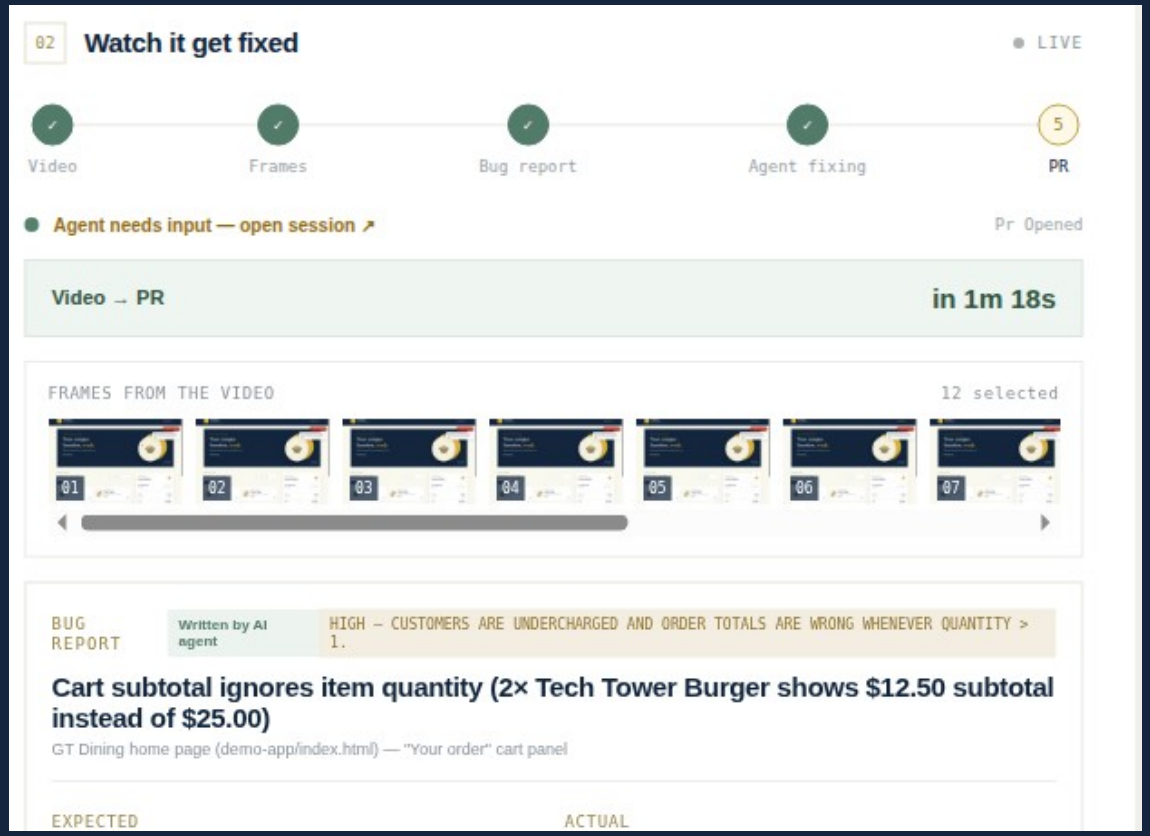

Agent opens the pull request

after reproducing and fixing in a browser

✓

Before / after verified

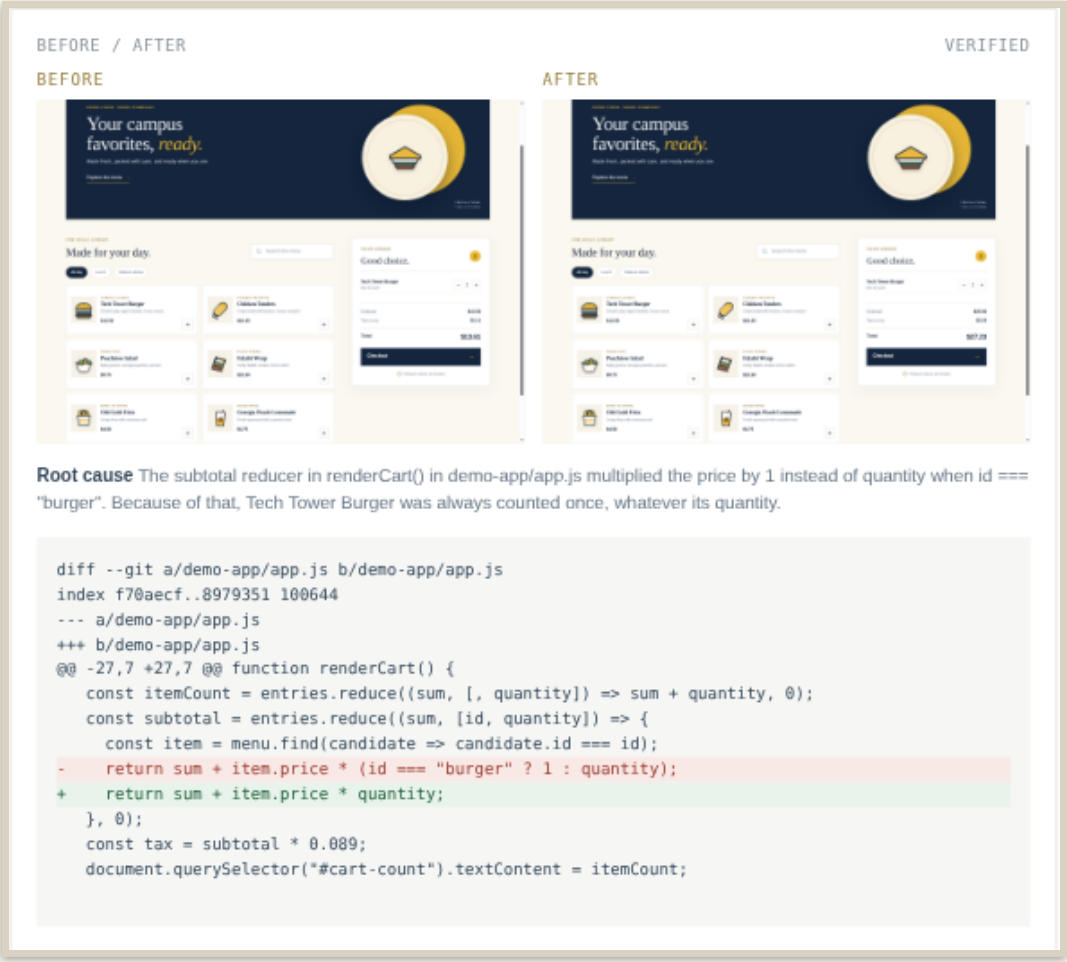

screenshots, root cause and diff on the page

Real AI agent session on this repo · PR #17

PROOF, NOT PROMISES

The agent shows its work.

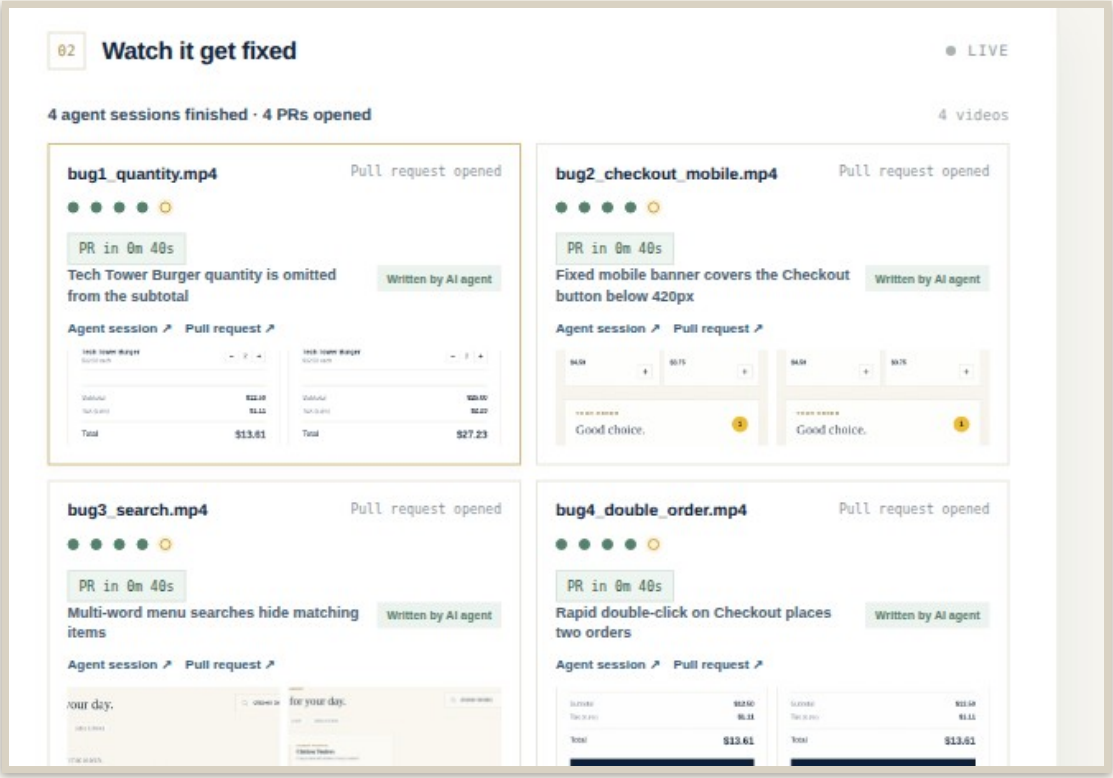

- Screenshot before the fix: 2 burgers, $12.50
- Screenshot after the fix: $25.00
- Root cause in plain English
- The one-line diff in the PR
- Click any image to go full screen

A human reviews and merges. Nothing ships on its own.

AT SCALE · ONE CLICK

Many videos. Straight to GitHub.

Drop 4 videos → 4 agent sessions run in parallel, each with its own report and PR. (Shown in backup mode.)

“Open as GitHub issue” prefills title + body from the agent’s report. “Copy as Markdown” for any tracker.

NOT A ONE-OFF

Eight real runs, eight real PRs.

#17 **Bug 1 · via “Report a bug”**
PR in 1m 18s · also #16, #14

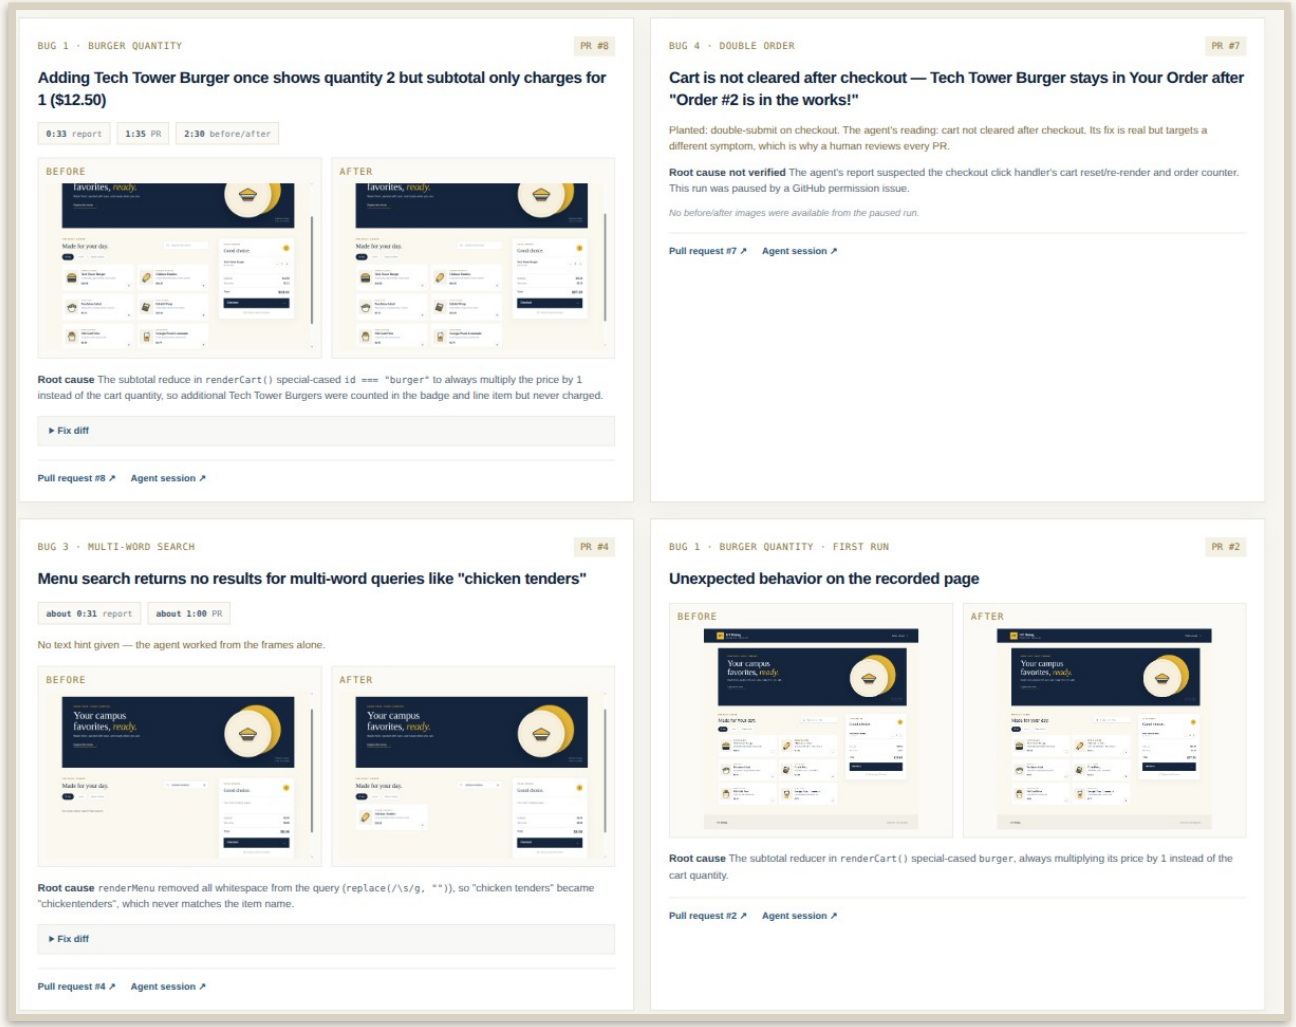

#13 **Bug 1 · burger qty**
PR in 1m 25s · also #8

#4 **Bug 3 · multi-word search**
PR in ~1m, frames only

#2 **Bug 1 · first run**
one-line fix

#7 **Bug 4 · double order**
The agent read it as “cart not cleared”

#7 is why a human reviews every PR.

WHY AN AGENT

One agent, the whole loop.

1. **Sees**
   Reads the video frames and writes a structured report

2. **Reproduces**
   Opens the real app and follows the steps

3. **Fixes + proves**
   Commits the fix with before / after screenshots

4. **Human stays in charge**
   Nothing merges without review

WHERE IT PLUGS IN

- “Report a bug” button: already built into the demo app
- One click: the agent’s report → GitHub issue
- Support desk: customer videos → PRs
- Parallel: 4 videos → 4 agent sessions at once
